SVILUPPO E INVILUPPO DI SOLIDI

Per realizzare queste attività di laboratorio procedere in questo modo:

1. Disegnare lo sviluppo del solido su un foglio spesso (di grammatura pari o superiore ai 200 g/mq). È importante che il disegno sia estremamente preciso affinché gli spigoli del solido una volta chiuso combacino perfettamente tra loro.
2. Disegnare le alette per l'incollaggio delle facce del solido. Le alette dovranno avere uno spessore pari a circa 1 cm affinché la superficie di incollaggio sia sufficiente.
3. Ripassare con la punta metallica del compasso tutti gli spigoli che dovranno essere piegati. La punta metallica del compasso dovrà essere utilizzata come una matita aiutandosi con una squadra o con la riga e calcando con una pressione non eccessiva per non strappare il foglio. La scalfitura faciliterà la piega che uscirà perfettamente a 90°.
4. Disegnare una lettera o un numero in ogni faccia secondo le indicazioni impartite a lezione. Per disegnare correttamente lettere e numeri è importante iniziare dal tracciamento delle stesse a "fil di ferro" con tratto leggero. Successivamente si procederà ad ingrossarle secondo il tipo di carattere scelto. E' possibile trarre spunto da una ricerca in rete: utilizzare la parola chiave "caratteri" e andare nella scheda "Immagini".
5. Completare sia le lettere/numeri che lo sfondo delle facce con delle textures a piacere, anche in questo caso sarà possibile trarre spunto da una ricerca in rete; utilizzare la parola chiave "texture" e andare nella scheda "Immagini".
   Per approfondire il concetto di Textures: https://www.didatticarte.it/Blog/?p=1610
6. Ritagliare lo sviluppo del solido facendo bene attenzione a comprendere nel ritaglio tutte le facce e tutte le alette per l'incollaggio.
7. Procedere all'incollaggio delle alette sulle facce facendo attenzione che stiano sul lato interno del solido in modo che non siano visibili una volta completato l'inviluppo.

Nella pagina successiva è presente l'inviluppo di uno dei solidi previsti.
